Medicine and Surgery

COURSE DESCRIPTION

The science and practice of illness diagnosis, treatment, and prevention is known as medicine. The term "medicine" refers to a broad range of healthcare procedures that have developed to prevent and treat disease in order to preserve and restore health. In order to diagnose, treat, and prevent injury and disease, modern medicine makes use of the biological sciences, biomedical research, genetics, and medical technology. These methods include surgery, pharmaceuticals, and a wide range of therapies like ionizing radiation, external splints and traction, psychotherapy, and medical devices.

For thousands of years, medicine was an art, a field requiring expertise and knowledge, and it was often associated with the philosophical and religious beliefs of the local people. For instance, a medicine man would use herbs and incantations to heal, or an ancient physician and philosopher might use bloodletting in accordance with humoristic views. Since the development of modern science several centuries ago, the majority of medicine has evolved into a synthesis of science and art (applied and basic, all falling under the purview of medical science). While suture stitching technique is an art that is acquired through practice, science provides the knowledge of what occurs at the cellular and molecular level in the tissues that are being sutured.
